Submitted (MPR-1991) to the EMBL/GenBank/DDBJ databases.
-!- SIMILARITY: Belongs to the mycobacterial PPE family.
-!- CAUTION: In strain Oshkosh the gene for this protein is interrupted in position 307 by an IS6110 element.
-!- CAUTION: Was originally (Ref.3) thought to be a dihydrofolate

                                                                                                                                                 Name=class 3;
IsoAe=224523-2; Sequence=VSP 006670;
SIMILARITY: Belongs to the TSC-22/Dip/Bun family.
CAUTION: Ref.2 sequence differs from that shown due to erroneous
           of
the second optic lobe relative to the first. Plays a role in determining proper dorsal cell fates leading to the formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein; Alternative splicing. GLN.
                                                           Event=Alternative splicing; Named isoforms=3;
Comment=Experimental confirmation may be lacking for some
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 1211;

Natl. Acad. Sci. U.S.A. 91:1519-1523(1994).

-!- FUNCTION: May serve as a docking site in the receptor-mediated import of substrates across the nuclear pore complex.
-!- SUBGNIT: Homodimer. Interacts with DDX19 and NUP88.
-!- SUBCELLULAR LOCATION: Nuclear pore complex. Cytoplasmic filaments.
-!- TISSUE SPECIFICITY: Expressed in thymus, splean, bone marrow, kidney, brain and testis, but hardly in all other tissues or in whole embryos during development.
-!- DOMAIN: Contains F-G repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             myeloid leukemogenesis, is a nuclear pore complex protein that faces

New immunogenic polypeptide(s) from soluble M. tuberculosis antigens useful for diagnosis of M. tuberculosis infection.

Example 3; Page 150-152; 190pp; English.

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TbH-9FL The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen,
